Conclusion

Is discounting of products beneficial?

YES, BUT!

- **More sustainable way, to attract indecisive & hesitant customers**
- **More useful on higher priced articles, reduces the inhibition threshold
→ less advised on cheap items, those may appear even cheaper!
(concern of the investor)**
- **Even after the discount ended
→ recurring attraction of new customers**

Data gathering/engineering

- **Developing protocols for prevention of data corruption**
→ more focus on the data prognosis, less on the processing of data
- **Standardized column format = more valuable data & preciser prognosis**
- **Clear categorization (incl. names of the individual categories)**
